

TECHNICAL DATA SHEET

1. TRADE NAME: **GLUE TUBE FOR RATS INVERDE**

Non-poisonous glue for rats, mice and insects, to be used on proper supports to detect the presence of *Rattus rattus*, *Rattus Norvegicus* and other big rodents, *Mus musculus musculus*, *Mus musculus domesticus* and other small rodents, and crawling insects.

Monitoring device that must be applied to control regularly the pests' presence in a domestic place for a defined time.

2. PRODUCT CODE: **P-14001IN**

3. PICTURE:

4. TECHNICAL SPECIFICATIONS:

Non-poisonous glue for rodents and insects in 135 g tubes.

Physical properties:

- Fluid product of average viscosity in semi-solid form under normal use conditions;
- Good resistance at temperatures from 5 °C to 35 °C;
- Non-volatile, non-flammable;
- Insoluble in water;
- Soluble in:
 - linear aliphatic solvents,
 - cyclic aliphatic solvents,
 - chlorinated solvents.

Chemical properties:

- The product is absolutely stable.
- It is non-toxic, it is inert, therefore it does not deteriorate during time.
- No incompatibility with other products.

Biologic properties:

- No physiological properties. Parasitic action: adhesive.
- Non-systemic product, not phytotoxic, odourless.

Colour: As in the picture

TECHNICAL DATA SHEET

5. HOW TO USE:

Spread Glue Tube for Rats InVerde on wooden boards, plastic boards, cardboard or any other non-absorbent material, whose dimensions are proper for the pest to be caught. A layer of few millimetres (1-2) is sufficient to have an effective trap. The layer of glue is not affected by temperature variations or bad weather. Efficacy lasts over time and stickiness, elasticity and cohesive force remain unaltered. The glue acts for a physical action and not a chemical one, as it keeps the rat thanks to its stickiness. Thanks to its non toxicity, the glue can be used everywhere without any particular preventive measure (houses, storehouses, restaurants, stables, chicken coops, etc.). It can be used also for catching insects like cockroaches, ants, flies, mosquitoes, crickets, etc. In agriculture, if spread around plants, it stops the crawling insects rise.

Place Glue Tube for Rats InVerde spread on a support in the following places:

- Near cable trough and electric boards, dishwashers, doors and slots, lofts, storehouses, producing departments, cellars, garages, workshops, etc.;
- Along the rooms perimeters to be disinfested and along the rodent habitual paths, which can be identified through excrements, fur, dens, paw prints, etc.;
- Along the walls;
- Use a support of adapted dimensions, according to the kind of pest to catch.

We suggest you to give a number to each trap and indicate its placement in the monitored area plan, in order to facilitate the check during the periodic monitoring.

Theoretical covered area: place Glue Tube for Rats InVerde on a support at a distance of 5-10 meters the one from the other, according to the assumed pest infestation.

Suggested monitoring period: all the year long, especially in the period between October and April, in which it is registered peaks due to the external temperature reduction.

Suggested frequency of the controls: weekly. Change the trap deriving from the product spread on a support after two months (at the latest) or before according to the pest infestation or the presence of dust, water and/or damp in the environment. The use of the trap in a dusty place could reduce the product functionality in the course of time, It is suggested its use inside multicatches or rodent containers.

Storage conditions: in a cool and dry room, temperature below 25°C and R.H. below 55%.
If well stored (intact packaging), the product shell life is 3 years.

Information on the Best Practice: Can be used in agri-food environments.

Evaluate the use of the product as it is or inside special containers, depending on the type of environment to be monitored.

The use inside containers allows to protect from dust and also to reduce the chances of catching non-target animals.

TECHNICAL DATA SHEET

In order to respect animal welfare, we recommend a frequency of control of the adhesive traps equal to several times / day (at least 2), as recommended by the Guideline on Best Practice in the Use of Rodenticide Baits as Biocides in the European Union, issued in September 2013 from EBPF (European Biocidal Products Forum).

If, in the control phase of the adhesive trap, a mouse was found alive, it must be killed quickly and humanely. A strong blow to the head is the most advisable method according to the 2006 Animal Welfare Act UK. Absolutely avoid drowning.

If catches of non-target organisms are found, contact a wild animal recovery center (or a wildlife center). The removal of the live animal by unskilled personnel can cause further suffering and injury. Try to remove the animal with liquid paraffin, and then clean it with soap and water, only when it has been impossible to find professional help.

6. PACKAGING AND SPARE PARTS:

- Pack: 1 piece
- Case: 50 pieces

7. DISPOSAL CONSIDERATIONS:

Waste disposal should be in accordance with existing Community, National and local regulations.
